

<b>Unit 1: Where is it? Use this grid game for 2D shapes, then 3D for those with secure 3D knowledge. Otherwise the positional element will be lost identifying shapes.</b>		<b>Autumn Shapes: Unit 1, Active Learning</b>
<b>Activity 2: Moving shapes</b>		
<b>Aims:</b> To understand and use directional and positional language.	<b>You will need:</b> 3-D shapes; '3 by 3 grid' ( <i>see resources</i> ); 'Position words' ( <i>see resources</i> )	
<b>Preparation:</b>		
<b>What to do:</b> <ul style="list-style-type: none"> <li>Choose a 3-D shape; place it in the middle of the '3 by 3 grid' (<i>see resources</i>).</li> <li>Give children instructions to place other shapes on the grid. <i>Put the cone above the cube. Place the sphere under the cylinder...</i> etc.</li> <li>Spread out the 'Position words' cards (<i>see resources</i>).</li> <li>Each child takes a card and must move a shape to create a statement to match their card, e.g. If Tom takes the card 'over', he moves the cuboid to the space over the cone and says. <i>The cuboid is in a space over the cone.</i></li> </ul> <p><b>Support</b> children by concentrating on two positional words at once e.g. <i>over</i> and <i>under</i> or <i>above</i> and <i>below</i>. Discuss opposites, then model and give lots of practice with these words before introducing others.</p> <p><b>Challenge</b> children by each pair having their own grid. They use their cards to place their 3-D shapes, until the grid is full or they cannot move.</p>		
<b>Outcomes:</b> I can understand positional language. I can position shapes in a grid following instructions. I can identify and name common 3-D shapes		

<b>Unit 1: Where is it? Also use this for identifying which children can quickly say 1 more or 1 less than the given number; "You have put 6 in the correct place. What is 1 more than 6?"</b>		<b>Autumn Shapes: Unit 1, Active Learning</b>
<b>Activity 3: Tiling instructions</b>		
<b>Aims:</b> To give detailed instructions using positional and directional language.	<b>You will need:</b> '4 by 4 grid' ( <i>see resources</i> ), '3 by 3 grid' ( <i>see resources</i> ); 'Number tiles 0 – 10' ( <i>see resources</i> )	
<b>Preparation:</b> Enlarge the 4 by 4 and 3 by 3 grid and the Number tiles ( <i>see resources</i> ). Place a grid in the middle of the table and place the number tiles in a pile face down.		
<b>What to do:</b> <ul style="list-style-type: none"> <li>Ask children to take a tile in turn. They place it on the 4 by 4 grid.</li> <li>After the first tile has been placed, each child must state where they are placing their tile in relation to at least one other tile on the grid, e.g. <i>I am putting the 4 above the 10.</i> OR <i>Here is the 6 beside the 3,</i> etc.</li> <li>Continue until all the tiles are on the grid.</li> <li>Challenge children to describe where the empty space is on the grid in relation to other numbers, e.g. <i>It is between the 3 and the 0, and it is above the 2.</i></li> <li>Remove the tiles and play again.</li> </ul> <p><b>Support</b> children by using a 3 by 3 grid and modelling the language used first. Help children to think about where they are placing and say a sentence together.</p> <p><b>Challenge</b> children by asking them to give each other instructions for where to place their tile, e.g. <i>Put it above the row with 9 in it</i> OR <i>Place it between the 7 and the 10.</i></p>		
<b>Outcomes:</b> I can use positional language when placing a number in a grid. I can give instructions using positional and directional language.
